

PROJECT SUMMARY

There are a large number of platforms that enable companies to recruit new staff simply by posting an advert on the site in question. Users can then apply for one or more vacancies by filling in a form, or by accessing an e-mail address provided by the company, which centralizes all applications.

However, these platforms are "generalist", i.e. they list a large number of advertisements for any type of job, in order to reach a larger number of customers. This forces candidates to register on several ad sites and to carry out advanced job searches to find the ads that match their field.

It was with this in mind, during my search for an internship, that I decided to create a platform dedicated to developers, which would centralize all ads relating to this profession, on the DevNow application.

As a result, the customer path is fairly simple and intuitive. It is divided into two categories:

Developers looking for a job will be able to consult a list of vacancies in their field, and if an advert catches their eye, they can send their application to the company via a link containing the company's recruitment email address.

The recruiter, for his part, must register and log in to gain access to a personal dashboard granting him the right to publish one or more job ad(s). They can also modify or delete them.

In an advanced version of the site, we can implement security by adding a captcha when the candidate sends an e-mail to avoid any type of spam, as well as an e-mail verification during registration.
